

INVITATION TO AN INTERACTIVE DINNER

DISCUSSING BIOMARKER IN METASTATIC BREAST CANCER

The program will be about DiviTum™TKa, an FDA cleared novel cell proliferation blood test that measures circulating thymidine kinase activity (TKa). The test is indicated for monitoring disease progression in breast cancer patients.

We will be reviewing the most recent TKa data presented by one of the lead authors:

- TKa in the adjuvant setting
- Using TKa levels to select patients for continued CDK4/6 based therapy after progression on a CDK4/6i
- Correlations and differences between TKa and ctDNA in patients with HR+ MBC

FDA-cleared!

Monitoring
MBC Treatment
with Simply
a Blood Test

For
Postmenopausal
HR+ women

MAVERICK
TEXAS BRASSERIE
